None the less, a large yield of partially purified virus can be obtained from either source which facilitates subsequent analysis of virus RNA. Guidance on the practical aspects of propagation of plant viruses can be found in reviews elsewhere (5, 6). 2.2 Assay of virus yield Assay of virus infectivity is a necessary adjunct to protocols for the concentration and purification of viruses.

One interesting biological similarity between the high and the low risk viruses is that both groups of viruses can maintain episomal viral DNA replication in cycling human keratinocytes.

Positive-strand RNA viruses contain nearly all of the plant viruses, a couple of insect viruses, and animal viruses, similar to coronaviruses, togaviruses, flaviviruses, poliovirus, hepatitis C, and rhinoviruses.
